**DETAILED ACTION**

1. Receipt is acknowledged of the Amendment filed 03 July 2002.

***Claim Objections***

2. Claims 7 and 9 are objected to because of the following informalities:  
  
Re claim 7: Substitute "it" with -- the box detecting circuit -- (see line 5).  
  
Re claim 9: Substitute "it" with -- the box container -- (see line 8).  
  
Appropriate correction is required.

***Claim Rejections - 35 USC § 102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) do not apply to the examination of this application as the application being examined was not (1) filed on or after November 29, 2000, or (2) voluntarily published under 35 U.S.C. 122(b). Therefore, this application is examined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (i.e., AIPA 35 U.S.C. 102).

Mazzone teaches a system for detecting an object and reading a barcode contain on the object comprising:

an object detecting circuit having an input connected to a laser reflection sensor to receive the sensor signals, and which generates a object detected signal indicating detection of a object when the magnitude of the output from the laser reflection sensor increase from a low level representing no object to above a predetermined level which represents reflections from a box, with the object detecting circuit having a circuit part that ignores an increase in reflectance from a barcode space element or other highly reflective surface that follows a brief decrease from an adjacent barcode bar element;

a data storage device that stores data representing the output of the laser reflection sensor; and

wherein the object detecting circuit is constructed to generate an object detected signal indicating detection of a object when the magnitude of the output from the laser reflection sensor increases from a low level representing no container to above a predetermined level which represent reflections from an object, and with the magnitude remaining above the object present level for at least a predetermined time representing object movement of a plurality of centimeters representing a object of minimum length. (See figure 1; col. 5, line 1 to col. 8, line 62)

The system further comprises a scanning laser source positioned to direct a scanning beam along a path; a laser reflection sensor positioned to detect reflections of

***Response to Arguments***
